## An equivalent formulation of matrix kernels

Miaoyan Wang, Aug 3, 2020

Let  $K(\cdot, \cdot)$  denote a usual kernel defined over pairs of vectors in  $\mathbb{R}^d$ . We use the shorthand  $K(i, j) = K(\mathbf{X}_{i:}, \mathbf{X}'_{j:})$  to denote the kernel evaluated on the vector pair  $(\mathbf{X}_{i:}, \mathbf{X}'_{j:})$ .

(Note: my definition of P seems to be the transpose of your definition of P.)

**Proposition 1** (Rank-1 weights in Kernel). Define a kernel over pairs of matirces  $\mathcal{K}(X, X') \stackrel{\text{def}}{=} \langle P^T \Phi(X) P, P^T \Phi(X') P \rangle$  for some  $P \in \mathbb{R}^{2 \times 1}$ . Then,  $\mathcal{K}$  has an equivalent representation,

$$\mathcal{K}(\boldsymbol{X}, \boldsymbol{X}') = 2C \sum_{i,j} w_{ij} K(i,j),$$

where the weight matrix  $\boldsymbol{W} = \boldsymbol{P}\boldsymbol{P}^T = [\![w_{ij}]\!]$  is rank-1, and C > 0 is a normalizing constant.

*Proof.* By definition,

$$\mathcal{K}(\boldsymbol{X}, \boldsymbol{X}') = \langle \boldsymbol{P}^T \Phi(\boldsymbol{X}) \boldsymbol{P}, \ \boldsymbol{P}^T \Phi(\boldsymbol{X}') \boldsymbol{P} \rangle$$
$$= \langle \underline{\boldsymbol{P}} \underline{\boldsymbol{P}}^T, \ \Phi^T(\boldsymbol{X}) \underline{\boldsymbol{P}} \underline{\boldsymbol{P}}^T \Phi(\boldsymbol{X}') \rangle \tag{1}$$

Both W and  $\Phi^T(X)W\Phi(X')$  are d-by-d matrices. The (i,j)-th entry of  $\Phi^T(X)W\Phi(X')$  is

$$[\Phi^{T}(\boldsymbol{X})\boldsymbol{W}\Phi(\boldsymbol{X}')]_{ij} = \sum_{s,s'} [\boldsymbol{\Phi}^{T}(\boldsymbol{X})]_{is} [\boldsymbol{W}]_{ss'} [\Phi(\boldsymbol{X}')]_{s'j}$$

$$= \sum_{s,s'} w_{ss'} \langle (\phi(\boldsymbol{X}_{s:}), \phi(\boldsymbol{X}'_{i:})), (\phi(\boldsymbol{X}'_{s':}), \phi(\boldsymbol{X}'_{j:})) \rangle$$

$$= \sum_{s,s'} w_{ss'} (K(s,s') + K(i,j))$$

$$= CK(i,j) + \sum_{(s,s')} w_{ss'} K(s,s'), \qquad (2)$$

where we have defined the constant  $C = \sum_{(s,s')} w_{ss'} > 0$ . Plugging (2) into (1) gives

$$\mathcal{K}(\boldsymbol{X}, \boldsymbol{X}') = \sum_{ij} w_{ij} [\Phi^{T}(\boldsymbol{X}) \boldsymbol{W} \Phi(\boldsymbol{X}')]_{ij}$$

$$= C \sum_{ij} w_{ij} K(i, j) + \left( \sum_{ij} w_{ij} \right) \left( \sum_{(s, s')} w_{ss'} K(s, s') \right)$$

$$= 2C \sum_{ij} w_{ij} K(i, j).$$

**Proposition 2** (Isomorphism; from mapping to kernel). The following two mappings are isomorphism.

phic, in the sense that they induce the same kernel K over pairs of matrices.

• Mapping 1

$$\Phi_1: \mathbb{R}^{d_1 \times d_2} \to \mathcal{H}_r^{d_1} \times \mathcal{H}_c^{d_2}$$

$$\boldsymbol{X} \mapsto (\Phi_r(\boldsymbol{X}), \Phi_c(\boldsymbol{X})) \stackrel{\text{def}}{=} (\phi_r(\boldsymbol{X}_{1:}), \dots, \phi_r(\boldsymbol{X}_{d_1:}), \phi_c(\boldsymbol{X}_{:1}), \dots, \phi_c(\boldsymbol{X}_{:d_2}))$$

• Mapping 2

$$\Phi_2: \mathbb{R}^{d_1 \times d_2} \to (\mathcal{H}_r \times \mathcal{H}_c)^{d_1 \times d_2}$$

$$\boldsymbol{X} \mapsto [\Phi_2(\boldsymbol{X})_{ij}], \quad \text{where } \Phi_2(\boldsymbol{X})_{ij} = (\phi_c(\boldsymbol{X}_{i:}), \phi_r \boldsymbol{X}_{:j})$$

*Proof.* Using the similar argument in Proposition 1, we can show that the kernel induced by (mapping 2 + low-rank coefficients) is

$$\mathcal{K} \colon \mathbb{R}^{d_1 \times d_1} \times \mathbb{R}^{d_1 \times d_1} \to \mathbb{R}$$

$$\mathcal{K}(\boldsymbol{X}, \boldsymbol{X}') \mapsto \sum_{i,j \in [d_1]} w_{ij}^{\text{row}} K_r(i,j) + \sum_{i,j \in [d_2]} w_{ij}^{\text{col}} K_c(i,j), \tag{3}$$

where  $\boldsymbol{W}^{\mathrm{row}} = [\![w_{ij}^{\mathrm{row}}]\!] = \frac{1}{c_1} \boldsymbol{P}_r \boldsymbol{P}_r^T$ ,  $\boldsymbol{W}^{\mathrm{col}} = [\![w_{ij}^{\mathrm{col}}]\!] = \frac{1}{c_2} \boldsymbol{P}_c \boldsymbol{P}_c^T$  are some p.s.d. low-rank matrices, and  $c_1 = \|\mathbf{1}_{d_1}^T \boldsymbol{P}_r\|_2^2 > 0$ ,  $c_2 = \|\mathbf{1}_{d_2}^T \boldsymbol{P}_c\|_2^2 > 0$  are two normalizing constants.

Now, we consider the kernel induced by (mapping 1 + low-rank coefficients),

$$\mathcal{K}(\boldsymbol{X}, \boldsymbol{X}') = \langle \Phi_r(\boldsymbol{X}) \boldsymbol{P}_r, \ \Phi_r(\boldsymbol{X}') \boldsymbol{P}_r \rangle + \langle \Phi_c(\boldsymbol{X}) \boldsymbol{P}_c, \ \Phi_c(\boldsymbol{X}') \boldsymbol{P}_c \rangle 
= \sum_{ij \in [d_1]} w_{ij}^{\text{row}} K_r(i, j) + \sum_{i, j \in [d_2]} w_{ij}^{\text{col}} K_c(i, j), \tag{4}$$

where  $\boldsymbol{W}^{\text{row}} = [\![w_{ij}^{\text{row}}]\!]$ ,  $\boldsymbol{W}^{\text{col}} = [\![w_{ij}^{\text{col}}]\!]$  are some p.s.d. low-rank matrices.

Two important properties in the induced kernels (3) and (4):

- 1. [Additivity] The new kernel is a linear combination of regular row and column kernels;
- 2. [Low-rank p.s.d.] The weight matrices  $\boldsymbol{W}^{\mathrm{row}},\,\boldsymbol{W}^{\mathrm{col}}$  are p.s.d. low-rank matrices.

Conjecture 1 (From kernel to mapping). Let  $\mathcal{K}(\cdot,\cdot)$  be a function that maps a pair of matrices to a real-value. Suppose  $\mathcal{K}(\cdot,\cdot)$  satisfies the above two properties. Then  $\mathcal{K}$  induces a valid feature mapping from  $\mathbb{R}^{d_1 \times d_2}$  to some Hilbert space.
